

Photo 1:

View looking north at the area where under-story and mature trees were previously removed. This area is within the 100-foot buffer zone to Great Island Lake. For restoration purposes this area has been identified as Disturbance Area B in the Restoration Plan and will be restored with plants as listed in this same plan.

(Photograph taken on October 2, 2007)

Photo 2:

View looking south at the area where vegetation was removed. Note that the vegetation at the edge of Great Island Lake was not removed during the clearing activities.

(Photograph taken on October 2, 2007)

Photo 3:

View looking south along Great Island Pond at the area of disturbance. The large boulders illustrated on the right side of the photograph are associated with the embankment to the houses along White Trellis. These boulders are also the approximate upper edge of the 100 foot buffer zone to the bank of Great Island Pond.

(Photograph taken on October 2, 2007)

Photo 4:

Photograph of the edge where clearing was halted. Previous to the clearing, the under-story was dominated by huckleberry (*Gaylussacia baccata*). As this plant is not commercially grown, it is not included in the plant lists. However, the area was not grubbed and the root mass for this plant was left intact. It will likely re-grow with time.
